Task Overview

The task involved updating a Unity script to make the "Play Again" button visible from the start, rather than hidden. The button is part of the game's user interface (UI) and needed to be active at game start while maintaining other functionalities.

Step-by-Step Process

1. Understanding Requirements: The task required making the "Play Again" button visible from the start.
2. Code Review: I thoroughly reviewed the provided code, which controlled ball movement, object collection, fall detection, and game winning conditions.
3. Identifying Key Change: The main change required was making the "Play Again" button visible initially.
4. Implementation: I modified the Start() method to remove the line hiding the button and ensured its activation at game start.
5. Ensuring Functionality: I preserved the button's onClick event, which triggered the Reset() method, ensuring other game logic remained intact.

Challenges and Solutions

- Button Visibility: Ensuring the button remained visible and functional without affecting other game logic.
- UI Behaviour and Testing: Handling edge cases where the button might not appear or interact properly.
- Performance Optimization: Ensuring the updated script didn't impact game performance, especially on lower-end devices.
- Cross-Platform Compatibility: Verifying the updated script worked seamlessly across different platforms (e.g., Windows, macOS, mobile).
- Collider and Physics Issues: Addressing potential collider and physics problems that could arise from modifying the button's behaviour.
- Animation and Graphics Glitches: Identifying and fixing any animation or graphics glitches caused by the updated script.
- Debugging and Error Handling: Implementing robust debugging and error handling mechanisms to ensure the updated script was stable and reliable.

Outcome

The "Play Again" button is now visible from the start, and all game logic functions as expected. The button still resets the game state when clicked. The process involved minimal but crucial changes to achieve the desired behaviour.
