

Browse menu use case description

Use case name	Browse Menu	
Scenario	A customer wants to check for food available on the menu for the online food delivery system.	
Trigger event	The Customer accesses the online food delivery system and chooses to browse the menu for food items.	
Brief description	The customer interacts with the system to go through the menu, go through the listed food details(vegetarian, price, rating, ingredients) and place and order.	
Actors	Customer, OFD system	
Related use cases	Add items to cart, place order	
Stakeholders	Customer, System administrators, restaurant owner	
Pre conditions	• The Customer must have access to the online food delivery system (via web or app). • The System must have the food menu loaded and available for browsing.	
Post conditions	• The Customer is able to view the available food items, optionally filter and sort the menu, and view individual item details. • The System has updated the display based on customer actions, such as applied filters or sorting. • The Customer may have added items to the cart and is ready to proceed with the order.	
Flow of activities	Actor	System
	• Customer accesses the online food delivery system. • Customer selects a category to explore e.g., "Mains." • Customer clicks on a food item to view more details (description, ingredients, nutritional info). • Customer can choose to add the item to their cart, or continue browsing other items.	• System presents the main menu, listing food categories such as appetizers, mains, drinks, desserts, etc. • System displays a list of items in the selected category with basic details like name, price, and short description. • System displays detailed information about the selected item, including images, descriptions, and other relevant details.

Exception conditions	• Menu Load Failure: If the menu fails to load (e.g., due to a system error), the customer is presented with an error message. • Out-of-Stock Items: If the customer clicks on a food item that is out of stock or unavailable, the system should notify them. • User Interaction Timeout: If the Customer remains inactive for too long while browsing the menu (e.g., the session times out), the system may prompt for re-login or session refresh.
